COURSE OUTLINE

Description

This course continues the exploration of the luminous and thermal environments by extending the design considerations to include lighting, HVAC and utility system consideration, acoustics, and the implications of all of these on sustainability. The course addresses mechanical, electrical and utilities systems selection and design; energy cost avoidance; energy code requirements; and sustainable architecture.

Objectives

The objectives of this course are to teach the student to understand:

- thermal and lighting performance in architecture
- methods for selecting thermal and electric lighting systems
- fundamentals of economic analysis for selection of energy systems
- implications of energy codes on building design
- fundamentals of life-cycle cost analysis building systems
- fundamentals of energy modeling
- fundamentals of vertical transportation
- basic electrical systems employed in buildings
- fundamentals of electric lighting systems
- fundamentals of electrical systems
- fundamentals of fire protection systems
- fundamentals of plumbing systems
- fundamentals of architectural acoustics
- fundamentals of building security systems

This course and its prior fall semester complement, ARCH4350/6350, in part or in its entirety is intended to satisfy the following NAAB Student Performance Criteria:

**B.6 Environmental Systems:** Understanding the principles of environmental systems’ design, which must include active and passive heating and cooling, indoor air quality, solar orientation, daylighting and artificial illumination, and acoustics; and an understanding of performance assessment tools.

**B.9 Building Service Systems:** Understanding of the basic principles and appropriate application and performance of building service systems such as plumbing, electrical, vertical transportation, security, and fire protection systems.

Teaching Philosophy

The built environment acts as the students’ own living learning laboratory and provides a means to integrate course concepts into explorations in studio and
professional practice. Lectures and readings form the foundation of the course. Recitations allow for a discussion and deeper exploration of specific course materials and concepts which typify situations that an architect encounters in practice. Projects are designed to sensitize students to the past, present, and future built world and how proven concepts of environmental control and sustainability can be integrated into the built environment.

Student interaction forms an important part of my teaching philosophy. The questions and the resulting discussions bring significant vitality to the course. Students are strongly encouraged to proactively ask questions to initiate discussions as well as seek clarity on materials presented in the lecture and recitations.

Outside the classroom, it is expected that students will also seek further inquiry that fosters the formation of their life-long learning skills. This includes completing class readings before each lecture, investigations at the library and other resources, working in study groups, and consultations with the teaching assistant and the instructor.

Organization

Class Hours
Lectures will be 9:10-10:25 AM, in Room 127 AAC as indicated on the syllabus. There will be a recitation period on 2:00-5:00 PM on Tuesdays in Room 127. Desk Crits and examinations will be in the 3rd floor studio.

Instructor/Office Hours Robert A. Young, FAPT, PE, LEED-ap; (801) 581-3909; young@arch.utah.edu; Room 240 AAC, M + T 10:30-11:30 AM; or by appointment.

Teaching Assistant
Joseph Briggs will be available for consultation outside of the classroom for questions regarding projects and will assist in grading.

WebSite
Students should periodically consult the instructor’s web site www.arch.utah.edu/young for updates on assignments and other course information.

Textbooks
Selected supplemental readings are on the class website. Refer to "Supplemental Readings" section below for titles. Other readings will be added as needed.

**Recitation**
There will be a recitation period on Tuesdays from 2:00-5:00 PM. The recitation will meet in Room 127 AAC, the third floor studio, Bailey Hall, or at site visit locations as described in the course schedule. Recitations will be composed of interactive exercises, site visits, discussions and review of course materials, release time, or studio consultations for projects.

**Decorum & Attendance**
Punctuality, professionalism, and leadership are valued by clients, employers, colleagues, and faculty. As such, students should be ready to begin class at the scheduled start time and be prepared to ask and answer questions. Pagers and cell phones must be turned off or set to non-audio mode. Do not eat in class.

Class begins with announcements and questions to and from the class and the resultant discussions. Participation goes beyond just coming to class and taking notes. Leaders ask questions and seek clarity to foster greater understanding for themselves and for the class. Leaders engage the class in learning course materials both inside and outside the classroom.

Due to the quantity of materials covered, it is recommended that students attend class lectures regularly, ask questions, and keep up with the reading. Students’ participation and leadership qualities in class lectures, recitations, and projects will be used in consideration of their final course grade.

**Projects**
These projects must be submitted to meet the course completion requirements:

1. Electric Light Fixture Project
2. Technology Integration Case Studies
3. Technology Integration Studio Project

Students are responsible for all in-class instructions on projects. **Unless otherwise stated, projects are due by the start of class on the day they are due.**
Project grades will be based on completeness, accuracy, technical comprehension, legibility, and originality. See grading form on the website for further information.

Late Policy

Late work will be penalized one full letter grade (e.g., an "A" will become a "B", etc.) for any part of the first calendar day and one full letter grade per day thereafter. All unsubmitted late work must be turned in by 5:00 PM on the last day of the regular semester classes (not finals week) to receive completion credit even though it may be too late for a letter grade.

Examinations

Examinations will be given in the third floor design studio and will be completed during the regular class period. The open book and open notes examinations will cover all readings, recitations, site visits, case studies, discussions, and lecture materials. Bring a #2 pencil, and a calculator. Questions should be answered on the grading sheet. Answer sheets and examinations must be turned in at the end of the examination. Students should leave when done so others may finish the exam undisturbed.

Results will be posted at a minimum of 24 hours after all students have taken the examination.

Arrangements for students with learning difficulties should be made prior to the examination. Makeup examinations will only be given for medical or legal related reasons. Students arriving late will be penalized for their tardiness (e.g., no extra time).

Children, pets, and guests are not allowed during the examination. Do not eat during the exam.

Grading

Final grades will be based on the following credit:

<table>
<thead>
<tr>
<th>Item</th>
<th>Credit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leadership &amp; Participation</td>
<td>150 points</td>
</tr>
<tr>
<td>Electric Lighting Fixture</td>
<td>100 points</td>
</tr>
<tr>
<td>Technology Integration Case Studies</td>
<td>100 points</td>
</tr>
<tr>

<td>100 points</td>
</tr>
<tr>
<td>Examinations (2 @ 150 points)</td>
<td>300 points</td>
</tr>
<tr>
<td>Total</td>
<td>750 points</td>
</tr>
</tbody>
</table>
Grades will be based on these cut off percentage points:

- A: 93
- A-: 90
- B+: 87
- B: 83
- B-: 80
- C+: 77
- C: 73
- C-: 70
- D+: 67
- D: 63
- D-: 60
- E: <60

### Accessibility

The University of Utah College of Architecture + Planning seeks to provide equal access to its programs, services, and activities for people with disabilities. If you need accommodation, prior notice needs to be given to the Center for Disability Services, 162 Olpin Union Building, 581-5020 (V/TDD). All written course information can be made available in alternative format with prior notification to the Center for Disability Services.

### Addressing Sexual Misconduct

Title IX makes it clear that violence and harassment based on sex and gender (which includes sexual orientation and gender identity/expression) is a Civil Rights offense subject to the same kinds of accountability and the same kinds of support applied to offenses against other protected categories such as race, national origin, color, religion, age, status as a person with a disability, veteran’s status or genetic information. If you or someone you know has been harassed or assaulted, you are encouraged to report it to the Title IX Coordinator in the Office of Equal Opportunity and Affirmative Action, 135 Park Building, 801-581-8365, or the Office of the Dean of Students, 270 Union Building, 801-581-7066. For support and confidential consultation, contact the Center for Student Wellness, 426 SSB, 801-581-7776. To report to the police, contact the Department of Public Safety, 801-585-2677(COPS).

### University Curriculum Administration Notes

- Last day to drop (delete) classes: January 21, 2014
- Last day to add classes: January 26, 2014

ELECTRIC LIGHTING FIXTURE

Introduction

This project is an opportunity to design light fixtures using standard components as an architectural expression. Electric lighting can use architectural elements drawn from the vocabulary of a building itself to provide illumination to a given space. Safety requirements that dictate fixtures must satisfy conditions for safety from overheating and potential injury from handling the lamp are of utmost importance for this project.

Objectives

The objectives include:

- To enhance visual analysis skills.
- To enhance understanding of light fixture design and construction.
- To design a point source light fixture.

Procedure

Design a point source light fixture for use on a table or desk based on your design subject for this semester’s studio project. The lamp within the fixture should not be visible when in use. Attention to glare and the appropriate cut off angles should be considered as integral to the basic design. In preparing the design, ask yourself the question “Would someone pay an architect to design this light fixture rather than simply buy it from a local distributor?” If you cannot answer this affirmatively, then you should continue refining the design until you can.

Good lighting fixtures provide a well-designed composition of elements that safely meets performance requirements and adheres to budget constraints. For this project 60W incandescent lamp is suggested to keep costs down. However, more expensive lamps (e.g., compact fluorescents, LED) may be used as students’ economic situation allows. Although the impulse to use high end materials and components may tempt you to spend a significant amount of money, the raw materials and components for the finished light fixture should cost no more than $50. With careful attention to materials and components, the project can be successfully completed for significantly less than that amount. The reuse of “found” or recycled materials is encouraged.

Components such as transformers for low voltage lighting systems, touch sensitive switches, LED components, and fiber optics can be expensive and may require a lead time (e.g., 5 or more business days for normal delivery) if ordered from online distributors. If you are ordering components online, allow for the lead time needed for their delivery.
Keep it simple! One useful approach is to understand the fixture as a collection of smaller pieces arranged into a larger composition. This is the basis of the paper and wood fixtures available at popular contemporary furniture stores.

Suggested materials include paper, balsa wood, tin foil, glue, and finishes (paint or other coatings). You are welcome to explore other materials, such as glass, metals, plastics, and recycled/found objects. Although in practice, lighting fixtures can be wired into an electrical system and controlled by a wall-mounted light switch, for this project, all fixtures must have an on/off switch and be able to be plugged into a standard wall receptacle.

The fixture should be vented to allow heat from the lamp to escape. To reduce fire hazard, materials should not touch the lamp. Above all, unless you intend to develop an appropriate structural support system, keep it lightweight.

The light fixture should sit on a table top. **No surface mounted, pendant, or floor mounted fixtures will be accepted.** Fixtures must be assembled from "scratch" and not simply consist of a reused fixture, although components from other fixtures may be salvaged and reused. **The finished fixture, when fully assembled, must be operable and fit within a 24” cube. Failure to do so will penalize the project up to one full letter grade for each missed requirement.**

The fixtures will be evaluated based on visual comfort attributes (glare elimination and functionality), accuracy and presentation of specification sheet, quality of craftsmanship, safety, functional operation, maintainability, and design aesthetics. Fixtures should be designed to withstand the heat of the lamp so as to not overheat, melt, burn assembly materials, or surrounding surfaces. Fixtures should include precautions for safety (e.g., no sharp or jagged edges, or pointed protrusions which may injure the user).

Having assembled the light fixture, develop the description and specifications used in the marketing of commercial lighting fixtures. Measurement of the lamps should be made in a room with no exterior light sources. Ideally the floors, walls, and ceilings should be dark to minimize the unwanted effects of light reflected from these surfaces. You should place your fixture so that the light source has a minimum 42 inch clearance to allow light measurement. Your objective is to make a series of seven light meter readings with the light meter sensor aimed at the light, each at a distance of 36 inches from the center of the lamp. For suspended fixtures, the first should be with the light meter directly above the fixture with the sensor aimed down; the last should be directly below the fixture with the sensor aimed up. Intermediate readings should be made at the 30 degree increments with the meter sensor aimed at the center of the light. For table-top and surface-mounted fixtures begin on one side of the fixture and complete the seven readings in 30 degree increments until completing the 180 degree arc.
Calculate the candlepower (CP) at each angle increment using the following formula:

\[ CP = fc \times D^2 \]

where:
- \( CP \) = candlepower
- \( fc \) = meter reading in foot-candles
- \( D \) = distance from center of light source to meter, in feet.

For example, if a reading of 130 fc was taken with the meter 36 inches from the center of the light, the candlepower \( CP = 130 \times (3)^2 = 1170 \).

Graph the CP of your lamp on the photometric chart. In the specification sheet for surface mounted fixtures, orient the photometric curve to indicate the surface orientation relative to the light fixture. Be sure to scale your graph by labeling the CP circles on the graph. The single-page, single-sided (8-1/2” x 11”) “catalog cut” (see suggested arrangement example below) should include:

1. Designer: your name
2. Name of Lamp
3. A photo of your lamp.
4. Specifications/Description: this is to be a verbal description of the lamp, the resulting light characteristics, and possible applications.
5. Section and Dimensions: include a clear, simple line drawing of the lamp in section with dimensions noted.
6. CP photometric distribution curve.

Schedule

This project will take the first four weeks of the semester.

Week 1: Develop schematic for lamp based on your design studio project parti.
Week 2: Desk Consultations
Week 3: Desk Consultations
Week 4: Presentations; project due as shown on syllabus

Product

For the lighting exhibit, prepare a 1-3 minute oral presentation of how the fixture represents your studio project parti and how the fixture will be used in the building. Use the template provided below as the guide for the specification sheet so that the class projects can be compiled into a catalogue. You are encouraged to make it a more powerful presentation through the use of color, computer graphics, etc. Submit your fixture on the date given on the syllabus along with your specification sheet for comments. On Canvas, upload a copy of the specification sheet file and three high quality photos of your fixture that will be considered for inclusion in the class gallery on the College website.
Grading Criteria

The specification sheet must include the required components given above. A suggested layout is below but students may design their own layout so long as it includes the required information. The fixture will be graded on design creativity, functionality (the lamp must be operable and produce the desired light for its intended purpose), safety considerations, utility considerations (switch location, ease of changing the lamp), design integration of components (coordination of color/materials, cord color, cord switch or other switch type).
TECHNOLOGY INTEGRATION CASE STUDY

Introduction

This project provides an opportunity to further explore building technology as a case study. This case study can take either of two formats. The first format is to identify a particular building and investigate how the building systems have been integrated within it. The second format is to take a particular technology and investigate how it is used in several buildings.

Objectives

The objectives of this assignment are:

- To introduce the student to the practice of evaluating how building technology is integrated into a building.
- To heighten the student's sensitivities to how the built environment (e.g., new and existing buildings) can be enhanced by these processes.

Procedure

As a team of 3 students, develop a case study that illustrates the topic you are investigating. The case study will (A) define the topic (250 words), (B) explain how you researched or developed the topic (250 words), (C) explain why an architect should be familiar with this topic (250 words), (D) explore examples and describe the implications for the future built and natural environments (2000-2500 words), and (E) provide your conclusions about this topic (250 words). Select one of the two following formats and pick a topic to investigate.

Format 1: Select a completed new construction or rehabilitation/adaptive reuse of an existing building. The building can be located in Utah or elsewhere in the world. Investigate the building (its systems and its context) to determine how well the construction methods, architectural tectonics and building systems are integrated to enhance its sustainability and the sustainability of the community where it is located. Where possible, show how the building is adapted (or not) to meet the demands of the local climate or is derived from the vernacular construction types prevalent in that climate region.

Format 2: Select a specific type of lighting or MEP system and show how it is used and integrated into contemporary buildings. The buildings can be located in Utah or elsewhere in the world. Investigate the system to determine best practices and concerns for how to integrate that system into buildings. Where possible, show how the system is selected based on the demands of the local climate or is derived from the vernacular construction types prevalent in that climate region.
Research and prepare the written case study that provides the information in criteria A-E as stated above. From the case study prepare a “Pecha Kucha” presentation (20 slides at 20 seconds each). Do not use Prezi. Then transform the presentation into a story board (e.g., Power point handout w/ 6 images per page; in a legible 8-1/2” x 11” format). The presentation should consist of an integration of narration, still images, drawings, and text. Use captions to note sources of photographs.

Grading Criteria

Refer to the grading criteria at the end of the syllabus or on the class website. Presentations that do not conform to the expected time lengths will be penalized.

Schedule

This project will take the first four weeks of the semester.

Week 5: Form teams of 3 students; sign up team with TA; identify topic
Week 6: Research
Week 7: Research
Week 8: Presentations; project due as shown on syllabus

Products

Students will prepare a 3000 word paper (approximately 12, 8 ½” x 11” pages of double spaced text, 12 point font with 1” margins). Graphics should be integrated within the text to highlight key points. All graphics or images not originally developed by the students must be given proper bibliographic credit. All graphics and images must be called out in the text and have captions. Students should use the Chicago Manual of Style as the basis of their writing. All assertions and conclusions should be based on existing factual evidence and not just opinion or conjecture.

Project must include a minimum of five bibliographic resources (e.g., books, journals, web site documents). Do not use resources from the class textbook or Wikipedia.

In writing the paper, keep the following criteria in mind:

1. **Proofread** manually. Spellchecker is not a proofreader.
2. Use **only** third person voice (e.g., he, she, they).
3. **Avoid contractions** (e.g., “do not” instead of “don’t”).
4. Use **headings** to delineate major areas of the paper (e.g., introduction of research question or issues, case studies, discussion, and conclusion).
5. Include captioned graphics (e.g., “Figure 1: Front façade of XYZ building”) within the body of the text for visual interest and to clarify a point of discussion. Call out figures in text (e.g., “(Figure 1)”).

6. Cite sources of images and quotes.

7. Include a bibliography at the end (note: the text for this is not included in the word count).

8. Use appendices where appropriate to maintain flow within the main body of the paper. Use call outs (e.g., “see Appendix A”) where appropriate.

9. Do not use Wikipedia or your textbook as a source.

Each team will present their findings and lead a discussion on their topic as shown in the schedule. The format will be as a “Pecha Kucha” that consists of 20 slides presented at 20 seconds apiece. Upload your case study, the final digital presentation, and your final presentation story board file to Canvas.
TECHNOLOGY INTEGRATION PROJECT

Introduction

It is critical to integrate environmental control technologies into designs to enhance the quality of life and mitigate the depletion of natural resources. Using architectural form as an environmental control system is a fundamental practice that enhances environmental awareness and sensitivity towards sustainability.

Objective

To introduce the student to the integration of environmental controls technology into sustainable building design and to heighten the student’s sensitivity to the interactions of thermal, visual, and acoustical comfort.

Procedure

Each student will use their final studio project to demonstrate her or his ability to integrate the concepts covered in environmental control systems and technology integration courses. The student will consult with the instructor or the TA to develop the sustainable design strategies as noted on the syllabus. The student will integrate the environmental control strategies into the drawings, images, and models required for the studio presentations and juries. Concepts should be clearly articulated and readily legible. The student should include “vignette” drawings and sketches to explain environmental control concepts directly in this summary report (8-1/2 x 11 format, approximately 10-15 pages long) to describe the integrated concepts. A summary set of 8-1/2 x 11 versions of their studio drawings is required in an appendix. While a student can develop new drawings and graphics not used in the final studio drawings, the primary images used in the summary will come directly from the drawings and other images used in the student’s final presentation. This is to be an explanation of how the concepts were specifically used in the project and not a review of the generic theoretical application. Make this summary specific to your project. Do not use images or graphics from the textbook or lecture power points.

Product

Two versions of the summary should be uploaded to Canvas. One shall be in its native format (e.g., .doc, .ppt, ind, dwg, etc.) and one shall be a .pdf version of the original. A printed version also must be submitted to the instructor. All environmental strategies must be legible within the summary.

Grading Criteria

Grades will be based on integrating environmental controls as follows:

Daylighting and Passive Thermal Systems 50
HVAC and MEP Systems 40
Acoustics 10
100%
